

# Tutorial: The Last Mile: Copper, Fiber and Wireless

Lesson 7 The Last Mile: Copper, Fiber and Wireless from the new course Introduction to Broadband Converged IP Telecom.

***Click the illustration to watch the full lesson free, in full quality, with our compliments.***

*This lesson is an introduction to network access technologies, called the "last mile", the physical connection between the user and the network; the face of the telecom network to users.*

*We group access technologies by physical medium: copper, fiber and wireless, then survey the main technologies in each area.*

*Subsequent courses and lessons drill deeper into the technologies. This lesson is part of the introduction.*

*Copper includes twisted pair loops, LAN cables and old-fashioned T1s, as well as coaxial cable CATV infrastructure.*

*Fiber means Optical Ethernet, shared links for residences via Passive Optical Networks and dedicated links for businesses.*

*Wireless includes 4G LTE and 5G, used for both fixed and mobile applications, and satellites.*
